### ABSTRACT

Supplier's choice is one among the foremost essential activities of supply chain management. Supplier's choice could be an advanced activity involving qualitative and quantitative multi-criteria. A trade-off between these tangible and intangible factors is essential in choosing the most effective Supplier. This paper utilizes AHP in selecting the most effective suppliers. A problem involving the supplier selection out of 4 Suppliers A, B, C, and D is formulated. AHP method with the help of Matlab Software is utilized to calculate the weights of criterions, sub criterions and sub sub criterions for the 4 suppliers. The global weights are then calculated and compared. The results are tabulated and the best supplier out of the 4 suppliers is selected and the detailed process involving the complex Matlab calculations is depicted. Based on the given data it was found that out of the four suppliers the supplier A is the best supplier.

### **KEYWORDS:** Analytic Hierarchy method (AHP), Supplier choice, Total worth of Purchasing (TVP) **INTRODUCTION**

#### AHP (Analytic Hierachy Process)

The issues of Supplier's choice have attracted the interest of researchers since 1960s, and plenty of researches during this space have evolved .Analytic Hierarchy Process is one of Multi Criteria decision making method which was developed by Prof. Thomas L. Saaty [1]. It is a method to derive ratio scales from paired type comparisons. The inputs can be obtained from the actual measurement such as price, weight etc., or from the subjective opinion such as satisfaction feelings or preference. AHP allows some small inconsistency in judgment because of fact that human is not always consistent. The ratio scales are derived from principal Eigen vectors and consistency index is derived from the principal Eigen Value.

Having a comparison matrix, at your expanse, now we would like to compute the priority vector, which is the normalized Eigen vector of matrix. We will use Matlab to compute the Eigen values and the normalized Eigen Vector. After this the sensitivity analysis can be performed.

Sensitivity analysis identifies the impact of changes within the priority of criteria on the suppliers' performance and order quantities. Once getting the initial resolution with the given weights of the attributes, sensitivity analyses were performed to explore the response of the general utility of alternatives and to changes within the relative importance (weight) of every attribute or criterion. The sensitivity analyses are necessary as a result of the importance of attributes or criteria, which needs different levels of trust, quality, cost, delivery, management and organization, financial and sourcing opportunities for the alternatives. A series of sensitivity analyses should be conducted.

# METHODOLOGY

#### **Model Development**

The objective of this work is to develop AHP technique for Supplier choice. The methodology of this work has been adopted from Yahya and Kingsman (1999), Tam and Tummala (2001) and Yu and Jing (2004) [2],[3]. So as to suits collecting quantitative and qualitative knowledge for AHP Supplier choice model that could be applied by the steel producing company ,a six steps approach was performed to insure thriving implementation as follows:

Step one: Outline criteria for supplier choice
Step Two: Outline sub criteria and sub sub-criteria for Supplier choice
Step three: Structure the class-conscious model
Step four: Place the order of criteria or sub criteria
Step five: Live Supplier performance.
Step six: Determine Supplier priority and choice

#### Sensitivity analysis of result

Sensitivity analysis identifies the impact of changes within the priority of criteria on the suppliers' performance and order quantities. Once getting the initial resolution with the given weights of the attributes, sensitivity analyses were performed to explore the response of the general utility of alternatives and to changes within the relative importance (weight) of every attribute or criterion. The sensitivity analyses are necessary as a result of the importance of attributes or criteria, which needs different levels of trust, quality, cost, delivery, management and organization, financial and sourcing opportunities for the alternatives. A series of sensitivity analyses should be conducted.

#### **Case Study of the Indian Steel Industry**

- Four Hydraulic Cylinder suppliers A, B, C, D were rated by the manager over various criterions, sub criterions and Sub Sub Criterions. The procedure enlisted below is used for it.
- Based on the interview conducted with the three managers R(1), R(2) and R(3) the ratings out of the 10 is taken for criterion like Quality, Delivery etc and average rating is taken as the score for it.
- The criterions are Cost, Quality, Delivery and Faith. The main criterion along with sub criterion and sub sub criterion are shown in the Table:
- The ratings of the pair wise criterions are done on the basis of the Information Shown below:

#### The ratings of the pair wise criterions are done on the basis of the Information Shown below:

| Verbal judgment or preference   | Numerical rating |
|---|------------------|
| Extremely preferred   | 9                |
| Very strongly preferred   | 7                |
| Strongly preferred  | 5                |
| Moderately preferred  | 3                |
| Equally preferred   | 1                |
| Intermediate values between two adjacent judgments ( when compromise is needed) | 2, 4, 6, and 8   |

| Sr.No. | Criterions | Sub Criterions      | Sub Sub Criterions       |          |
|--------|------------|---------------------|--------------------------|----------|

### SupplierD

0.966808

#### The Sum of the Global Weight in the case of 4 suppliers are as follows

SUPPLIER A: 0.969916 SUPPLIER B: 0.955688 SUPPLIER C: 0.964307 SUPPLIER D: 0.966808 The sum of the global weights is highest in case of Supplier A and thus it is the best supplier.

### CONCLUSION

The issues of Supplier's choice have attracted the interest of researchers since 1960s, and plenty of researches during this space have evolved. Continuing the previous works in Supplier choice space, the work has got success in achieving its objectives.

The contribution was a development of a multi-criteria model for analysis and choice which is employed for Supplier choice in JSW Steel Limited. The use of AHP process is critical in the Supplier Choice process and the latest Software Packages like MATLAB are used to solve for the weights and decide the relative importance of the criterion.

The AHP Technique was applied on all the four suppliers A, B, C and D and weights (Local and Global) are calculated. Based on the above analysis described the supplier A was concluded to be best supplier having t he highest sum of global weights.

It was concluded that the AHP Process is very useful in Supplier selection and Tools like Matlab can help in the complex calculations involved.

#### **Future Work**

The AHP technique is used for supplier selection in the present paper. In the future work many other advanced techniques can be used for supplier selection. The use of genetic algorithm along with neural networks can be done to give better and accurate results. Also the number of criterions and sub criterions can be increased and the solution of the problem can be performed in completely simulated environment. The supplier selection process using AHP can be extended for other industries rather than only steel industries can be executed.
